Terror-Eyes

BIRD CONTROL SOLUTIONS

Moving Eye holographic repeller Inflatable predator frightens birds away

- Huge 24" menacing ball
- Moving eyes on front and back strike fear in birds
- These lenticular eyes produce holographic effects, constantly changing as if they are "following" birds.

Terror Eyes is an extremely realistic and frightening predator - an award winner in Japan as the foremost method of repelling birds from crops.

Terror-Eyes can be used alone or in combination with electronic sound/ultrasound devices or chemical repellents.

SYNERGY (combining types of scares) is always the most effective approach to pest bird control.
